## High Precision Ball Bearings

PM 001/04 E

## High Precision Ball Bearings

GMN produces high precision ball bearings in precision class P4 (ABEC7) or better as spindle bearings (angular contact bearings), radial deep groove ball bearings as well as hybrid bearings and special bearings.

In addition GMN offers complete bearing units.

A variety of solid lubricant coating is available for operation under vacuum.

## Spindles

GMN machine spindles represent more than 70 years of experience in development, production and application. They are used for precision as well as for HSC high-speed processing. A close-knit network of dealers and repair service workshops guarantees comprehensive service and expert advice.

GMN optospindles, air bearings and scanners are setting new standards in image projection. They have been developed for maximum running accuracy as well as stability in rotational speed and phase.

## Freewheel-Clutches

Freewheels are unidirectional couplings, transmitting or supporting torque in one direction by friction and allowing idling in the opposite direction.

GMN manufactures sprag type clutches of two different sprag sizes to be used as indexing devices, backstops or overrunning clutches. Roller ramp supplements are available too.

## Non-Contact Seals

GMN offers two different systems of non-contact seals for wear free sealing of fast turning machine components.

The GMN labyrinth seals are made from steel and aluminium by a special and very sophisticated production process which results in absolute identity of the inner and outer rings labyrinth profile.

The GMN gap seals with return drain are made from high quality, highly resistant plastic material.

## Technical information

### ... about the product

• Spindle ball bearings · Deep groove ball bearings · Boundary dimensions	16-15
• Bearing series spindle ball bearings	7-19
• Contact angle, internal clearance	10-15
• Cages	11-15
• Closures, materials	12-17
• Hybrid bearings with ceramic balls	13-15
• Precision classes and tolerance tables	16-17
• Quality assurance	18-19

### ... for design of the bearing application

• Preload, rigidity, lift-off force	20-22
• Bearing arrangements	23-29
• Lubrication	30-31
• Accuracy of associated components	32-33

### ... for bearing calculation

• Method of calculation	34-15
• Nominal and modified lifetime	35-15
• Static load rating	36-15
• Service life of the grease	37-15
• Limiting speed	38-39

### ... for assembly

• Basic rules for storage and assembly	40-15
• Failure analysis	40-15
• Change of preload	40-15

## Bearing tables

### Spindle bearings

• Designation code	41-15
• Interchangeability chart	42-15
• Explanation of notations	43-15
• Bearing characteristics	44-55

### Special bearings

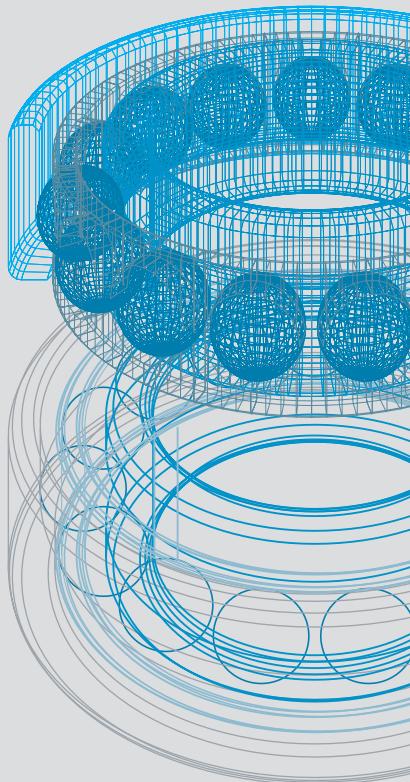

56-15

### Deep groove bearings

• Designation code	57-15
• Explanation of notations	58-15
• Bearing characteristics	59-15

## Spindle bearings

Spindle bearings are angular contact bearings.

### Characteristics

- Support of axial load in one direction only
- Adjustment against a second bearing is necessary
- Higher ball complement than with deep groove bearings
- High rigidity and loading capacity
- Suitable for high speeds

The forces are transmitted from one raceway to the other under a specific contact angle.

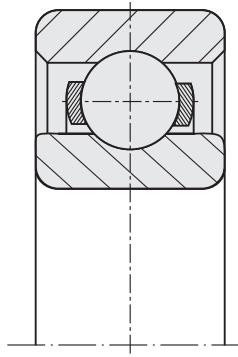

## Deep groove bearings

Deep groove bearings are radial deep groove ball bearings

### Characteristics:

- Support of axial and radial loads in both directions
- Suitable for high speeds

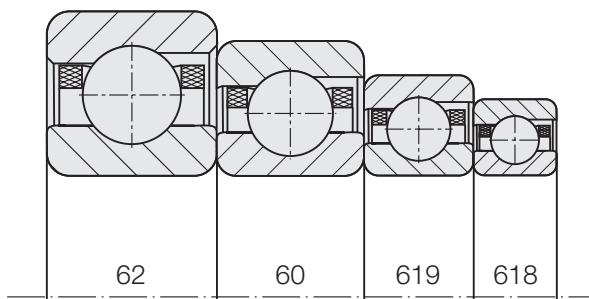

## Boundary dimensions

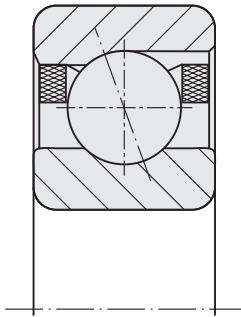

The boundary dimensions of ball bearings conform to the boundary dimensions laid down in DIN, ISO and ABMA Standards.

Depending on the series each bore size comes in several outside diameters and widths.

Series offered by GMN:

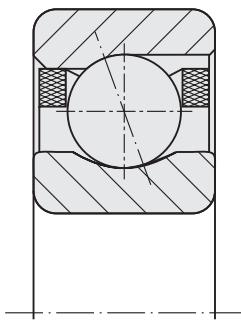

- Spindle bearing: 618.., 619.., 60.., 62..
- Deep groove bearing: 60.., 62..

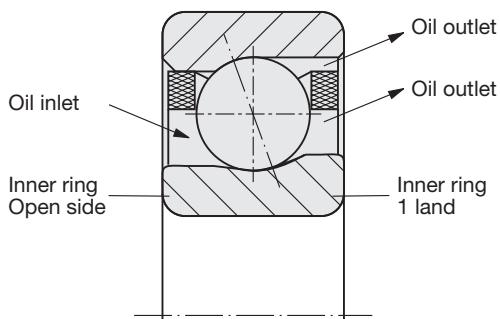

### Bearing series S...

- GMN standard spindle bearing
- Non-separable type

### Bearing series SM ...

- Geometry of inner ring modified for extremely high speeds
- Reduced load rating and static rigidity compared to bearing series S ...
- Equal or higher service life as with bearing series S ... due to lower friction
- Non-separable type

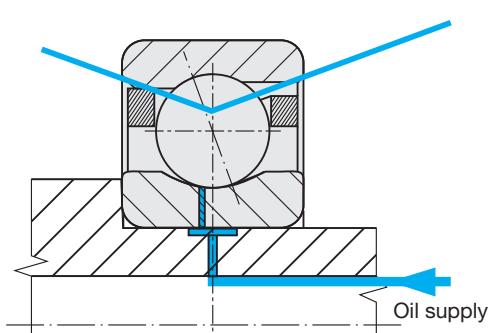

Bearings of this series are only available to precision classes HG, UP, P2 and ABEC 9

### Bearing series SH ...

A special design of series SM ...

- Optimised oil feeding, one land on inner ring
- Speed coefficient  $n \times d_m = 2.4 \times 10^6$  mm/min reliably possible with cooling lubrication
- Non-separable type
- Available only on request

### Bearing series SMI ...

A special design of series SM

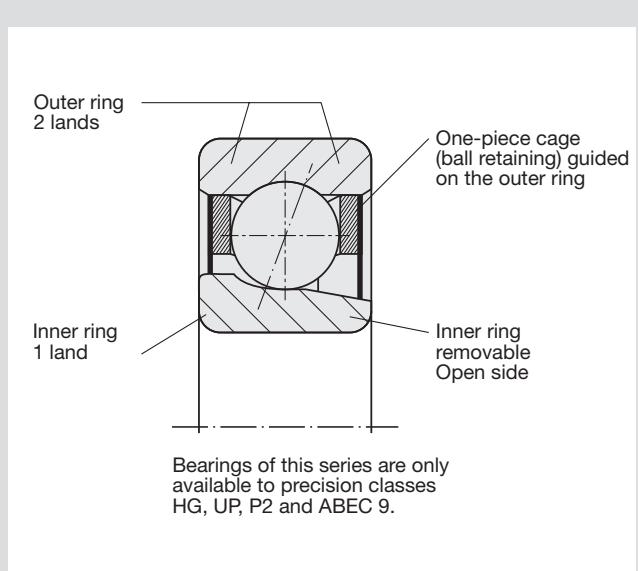

- Optimised for throw-away lubrication and extremely high speeds, it eliminates the need for the high oil feed, seal, and cooling system complexity of an oil injection system.
- High degree of reliability in operation is ensured by force-feed lubrication through the shaft and the bearing inner ring.
- Non-separable type
- Available only on request

## Separable type

- Simple mounting due to separate installation of inner and outer ring (when necessary).
- Balancing of rotating components with installed inner ring.
- A defined axial clearance of the bearing system is possible.

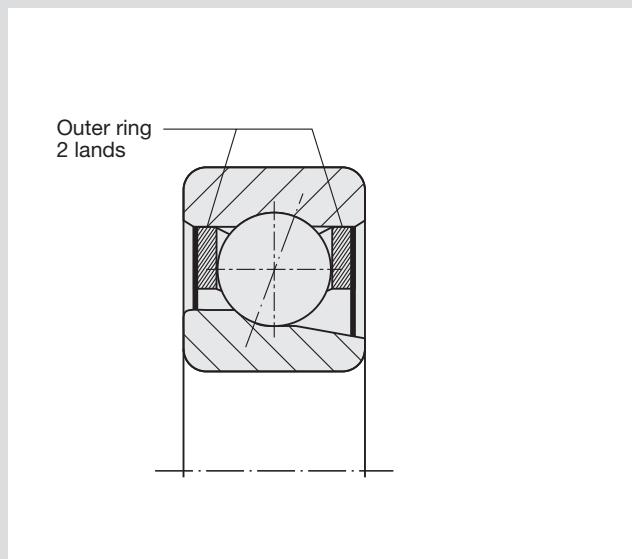

## Bearing series BHT ...

- The cage retains the balls in the outer ring, which means the balls do not fall out when the one-land inner ring is removed.
- The one-piece cage is guided on both lands of the outer ring.
- The contact conditions are the same as with bearing series SM ...
- Due to the ball retaining design of the cage, the ball complement is less than for bearing series SM.

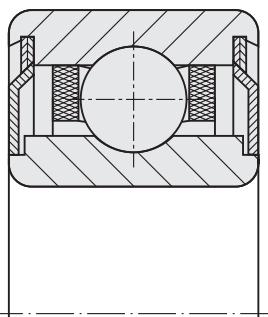

## Bearing series BNT ...

- Corresponds essentially to bearing series BHT ...
- However the contact conditions are the same as for bearing series S ...
- Due to the ball retaining design of the cage, the ball complement is less than for bearing series S ...

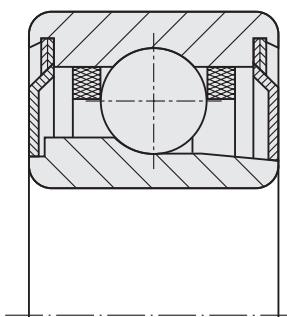

## Special bearing design

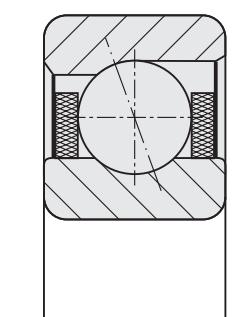

Available only on request

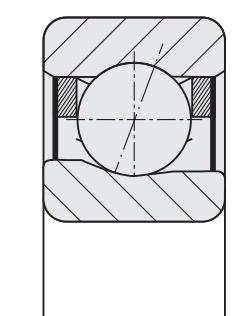

... X

BHT... X

S...TB

SN...TA

### Bearing series ...X and BHT ...X

- Non-separable type
- High-precision ball bearings of extra wide design with shields on both sides for high speed and grease lubrication are used in drilling, milling or grinding spindles for special operating conditions.
- The non-contact shields form a labyrinth seal together with the recess in the inner ring.
- The bearing friction is scarcely influenced by this. Due to the labyrinth seal, the lubricant is retained in the bearing so that the bearing can achieve long running times, corresponding to operating speeds, with only one grease fill (for-life lubrication).

### Bearing series S ...TB, SN ...TA

With grease lubricated spindle bearings and cage guided on one land, cage vibration can be generated at critical speed ranges.

In this instance there are two alternatives.

- 1. Use of TB- cage with bearing series S...

The cage is guided on the inner ring by two lands.

- 2. Use of TA-cage with bearing series SN ...

The cage is guided on the outer ring by two lands. The contact conditions are the same as with bearing series SM...

Please contact GMN for selection of these bearing designs.

## Contact angle $\alpha_0$

The contact angle is formed by a straight line drawn between the points of contact of the balls with the raceways and a plane perpendicular to the bearing axis.

Externally applied loads are transmitted from one ring to the other along this line.

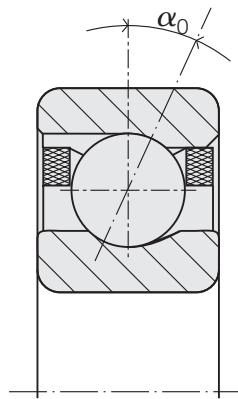

- The contact angle is designed into the bearing and changes during operation with the speed, the external forces and the difference in temperature between the inner and the outer ring.

With increasing contact angle

- Limiting speed decreases
- Radial rigidity decreases
- Axial rigidity increases

GMN manufacture spindle bearings with 15° and 25° contact angles.

Other contact angles available on request.

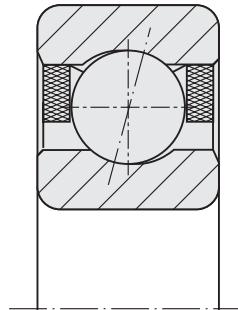

## Internal clearance

The internal clearance defines the amount by which one bearing ring can be displaced relative to the other without gauging load.

- Radial clearance: Displacement in radial direction
- Axial clearance : Displacement in axial direction

The internal clearance of a bearing is not a quality feature.

## Cages for spindle bearings

Cage	TA	TXM	TAM	TB
<b>Material</b>	Textile reinforced phenolic resin Graphite impregnated polyamide	Polyetheretherketone (PEEK), thermoplast carbon fibre reinforced	Textile reinforced phenolic resin	Textile reinforced phenolic resin
<b>Permissible operating temperature</b>	120 °C	250 °C	120 °C	120 °C
<b>Cage guidance</b>	On outer ring	On outer ring ball retaining	On outer ring ball retaining	On inner ring
<b>Manufacture</b>	Machined	Moulded	Machined	Machined
<b>Notes</b>		High resistance to wear, grease remains in the ball/cage area. Better lube feed with oil lubrication. Well qualified for clean room assembly.	For bearings series BHT...and BNT	On request

Cages made of special material and with special treatment like aluminium bronze as well as special designs are available on request.

## Cages for deep groove bearings

Cage	T9H	TBH	J	TA, TB
<b>Material</b>	Glass-fibre reinforced polyamide	Textile reinforced phenolic resin	Strip steel	Textile reinforced phenolic resin
<b>Permissible operating temperature</b>	140 °C	120 °C	220 °C	120 °C
<b>Design</b>	One piece, crown type	One piece, crown type	Two piece, clamped or riveted	Two piece, riveted

Cages made of special material like aluminium bronze, Canevasit, Torlon, PEEK and others are available on request.

## Closures

For long maintenance-free operation, deep groove bearings are charged with lubricant ready for operation (for-life lubrication) and are fitted with two metal shields.

The shields are fixed in the outer ring by means of snap rings. Bearing pairs in 2Z-execution carry the built-in shields on the outside faces.

## Advantages

- Simple design possible
- Protection against foreign particles
- Protection against the escape of lubricant
- Minimal distortion of outer ring

## Materials

### Ball bearing - Rings

- Standard:  
Vacuum degassed chrome steel 100 Cr 6  
Heat treated for operating temperatures up to 150 °C
- HNS-Steel (High Nitrogen Steel)  
For applications which demand
  - higher speeds
  - higher resistance to wear
  - higher loading capacity
  - higher resistance to heat
  - higher corrosion resistance  
(on request)
- For higher temperatures up to 500 °C:  
High temperature steel (on request)

### Balls

- Standard:  
Vacuum degassed chrome steel 100 Cr 6
- Ceramic material silicon nitride  $\text{Si}_3\text{N}_4$
- For higher temperatures up to 500 °C:  
High temperature steel (on request)

## Hybrid bearings with ceramic balls

**Hybrid ball bearings** with steel rings and ceramic balls have today become indispensable for many advanced applications. The advantages have been clearly demonstrated in numerous trials and successful use in the field.

### Properties of ceramic

The ceramic material silicon nitride  $\text{Si}_3\text{N}_4$  is excellent for use in precision ball bearings. A comparison between silicon nitride and conventional bearing steel 100 Cr 6 is shown in diagram 1.

Further advantages of ceramic are:

- Low chemical affinity to 100 Cr 6
- Low friction coefficient
- Little heat transfer
- Corrosion resistant
- Non-magnetic
- Electrically isolating

### Advantages for the user

#### Longer service life

Experience shows that double the service life in comparison to conventional bearings can be reached by using hybrid bearings. Depending on the operating conditions life times rates still higher can be achieved.

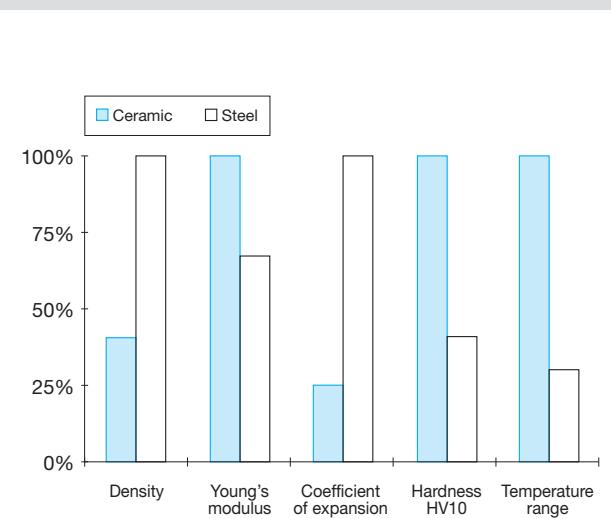

Diagram 1

Reasons:

#### • Low surface adhesive wear

The lower affinity to steel reduces the adhesive wear, which is caused by the cold welding effect on irregularities in the raceway and ball surface.

#### • Low abrasive wear out

With steel balls, contaminants and particles from the process of running in are embedded into the surface. With every revolution of the ball, these foreign particles damage the raceway. These particles make little impact on the extremely hard ceramic ball.

#### • Insensitivity to poor lubrication

Low adhesion and friction allow the hybrid bearing to perform well even under poor lubrication.

#### • Longer grease service life

Lower operating temperature and favourable tribolic features, extend the service life of the grease.

Properties (at ambient temperature)	Unit	Ceramic $\text{Si}_3\text{N}_4$	Ball bearing steel 100 Cr 6
Density	$\text{g}/\text{cm}^3$	3,2	7,8
Coefficient of expansion	$10^{-6}/\text{K}$	3,2	11,5
Young's modulus	GPa	315	210
Poisson's ratio	-	0,26	0,3
Hardness (Vickers) HV10	-	1600	700
Tensile strength	MPa	700	2500
Fracture toughness	$\text{MPa m}^{0,5}$	7	20
Thermal conductivity	$\text{W}/\text{mK}$	30-35	40-45
Spec. electric resistance	$\Omega \text{mm}^2/\text{m}$	$10^{17} - 10^{18}$	$10^{-1} - 1$

Properties of silicon nitride and ball bearing steel

## Higher speeds

The attainable speeds depend above all on the thermal conditions in the bearing. Because of lower friction, the hybrid bearing generates less power loss, therefore the speed limit is increased dramatically. Depending on the application, speed rises up to 30%, compared to bearings with steel balls, are possible.

- **Low rolling friction**

The rolling friction is reduced, as the centrifugal force of the lighter ceramic ball is less. The contact ellipse is less because of the higher Young's modulus.

- **Low sliding friction between ball and raceway**

At high speeds, sliding friction is responsible for most of the total friction.

One of the criteria for the sliding friction is a low spin/roll ratio.

The service life is affected by values above 0.25. Diagram 2 shows the advantages of ceramic balls.

- **Avoid ball skidding**

The balls skid on the raceway if the preload between the rings is too small. This process usually occurs in case of an insufficient preload of the bearing or an excessive acceleration. With hybrid bearings the minimum preload can be reduced as they have a smaller inertia and generate a smaller spinning moment.

## Low cost lubrication

- **Grease lubrication** can be used in higher speed ranges.
- The limiting speed for minimum **oil lubrication increases** significantly. In many cases, it can replace the expensive oil jet lubrication.

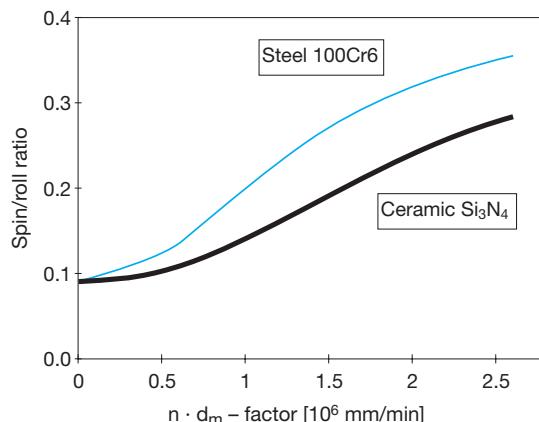

Diagram 2

## Higher rigidity

- The radial rigidity of hybrid bearings is approximately 15% higher at low speeds because of the higher Young's modulus.
- With higher speeds, the centrifugal force affects the internal load distribution and the dynamic rigidity is reduced. Diagram 3 shows reduced loss of rigidity for hybrid bearings.
- A high rigidity improves the accuracy and shifts the critical fundamental frequency of the bearing arrangement.

## Improved machining accuracy

The following factors lead to an improvement of the surface quality and accuracy of machined parts.

- Higher rigidity of bearing arrangement
- Small thermal expansion
- Low vibration impulse by ceramic balls

## Examples of application

### • Spindles for machine tools:

State of the art machining processes like high speed milling require a new concept of bearing arrangement for spindles. The application of hybrid bearings has resulted in a remarkable improvement of performance. For some years we at GMN have successfully used many spindles with hybrid bearings for our own production processes.

### • Special bearing arrangements:

With vacuum pumps, reliability of the bearings is of utmost importance, as breakdown can result in high costs.

### More applications are:

- Medical equipment like X-ray tube bearings
- Emergency bearings for magnetic bearings
- Bearings for aeronautic and aerospace

## Summary

When conventional bearings fail, the solution is often to use hybrid bearings. It is important always to take the whole system into consideration and to carry out a "weak point" analysis. Our experience in operating these bearings is at your service.

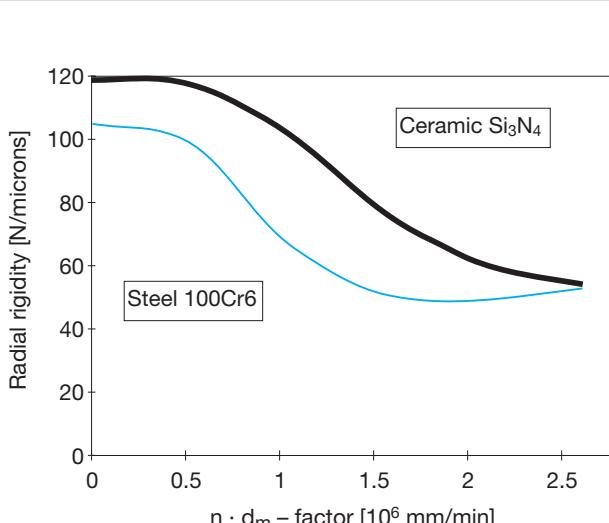

Diagram 3

**The tolerances** for dimensional, form and running accuracy of GMN high precision ball bearings are specified in international (ISO 492) and national standards (DIN 620). GMN high precision bearings are manufactured to precision class 4 and class 2 (P4 and P2) as well as ABEC 7 and ABEC 9. For special applications, e.g. vacuum pumps, gyroscopes as well as measuring engineering and optical systems, GMN manufacture bearings to the internal tolerance classes HG (high precision) and UP (ultra precision). Apart from the requirements mentioned, the tolerance classes

contain additional selection criteria. All GMN high precision ball bearings are also available in compliance with the American ABMA standards. The relationship between the various STANDARDS is explained below.

ISO	DIN	ABMA
class 4	P4	ABEC7
class 2	P2	ABEC9

The following tolerance symbols are laid down in DIN/ISO 1132.

#### Inner ring limits in micron

## Form and running accuracy

Low vibration level and high running accuracy are ensured by random sample production control on the rings and the balls. Form accuracy and surface finish are checked by using advanced precision measuring instruments, the runouts of assembled bearings are checked 100%.

## Vibration

The vibration level depends, among other things, on:

- Form accuracy and surface finish of raceways and balls
- Cage design
- Cleanliness and method of lubrication

A 100% vibration test is carried out with all GMN high precision ball bearings. The spectral analysis carried out regularly by taking random samples gives information on the inner and outer ring as well as ball form accuracy. The vibration spectrum of a ball bearing is essentially discreet, the dominating frequencies are design related.

The specific frequencies of a bearing can be calculated with the aid of the formulae shown opposite.

## Contact angle $\alpha$

The contact angle depends on the radial clearance and the raceway curvature. A uniform load distribution within two or more bearings is given only when all bearings have identical contact angles. GMN provide such selected bearing pairs plus documentation on request.

Apart from highly advanced manufacturing machines constant production control ensures the uniform quality of GMN high precision ball bearings. Sophisticated measuring systems and quality assurance methods ensure a high degree of accuracy, low friction, a high degree of quiet running, highest speeds and a long service life.

Ball pass frequency  $f_{AR}$  on the outer ring

$$f_{AR} = \frac{Z}{2} \cdot f_i \cdot \left(1 - \frac{D_w}{T} \cdot \cos \alpha_0\right) [1/\text{sec}]$$

Ball pass frequency  $f_{iR}$  on the inner ring

$$f_{iR} = \frac{Z}{2} \cdot f_i \cdot \left(1 + \frac{D_w}{T} \cdot \cos \alpha_0\right) [1/\text{sec}]$$

Ball spin frequency  $f_w$

$$f_w = \frac{f_i}{2} \cdot \left(\frac{T}{D_w} - \frac{D_w}{T} \cos^2 \alpha_0\right) [1/\text{sec}]$$

Cage rotation frequency  $f_K$

$$f_K = \frac{f_i}{2} \cdot \left(1 - \frac{D_w}{T} \cos \alpha_0\right) [1/\text{sec}]$$

---

$f_i$  = Shaft frequency 1/sec

$D_w$  = Ball diameter in mm

$T$  = Pitch diameter in mm

$Z$  = Number of balls

$\alpha_0$  = Contact angle

When using such bearings provision must be taken to ensure that both bearings have the same contact angle after mounting and adjustment to operating conditions.

## Radial runout

Meeting the radial runout of the inner and outer ring, specified in the various standards, is 100% controlled. On request the highest point (max wall thickness) is marked by a point on the face. This is an additional

help for the user to minimise wobble. With bearing pairs or bearing groups of three or more and for precision class HG and up , this marking is provided automatically.

## Matching accuracy

The matching accuracy of +/- 2 microns ensures a uniform load distribution and a uniform operating temperature within the series. GMN offer bearing pairs with increased matching accuracy (+/- 1 micron) on

request. When specifying the type of matching, like DB, DF or DT for pairs or groups matching takes place to an optimum for precision class HG and up.

## Grading

When two or more matched bearings carry a load together the bore and outside diameter should be identical. Due to the selective pairing of bore and outside diameter the fitting on the shaft and in the housing are facilitated. On special request GMN grades the tolerances of bore and outside diameter. The suffix here to is "X".

Tolerances smaller than 3 microns are not graded. The grading groups can, for practical reasons, only be selected, but not manufactured separately.

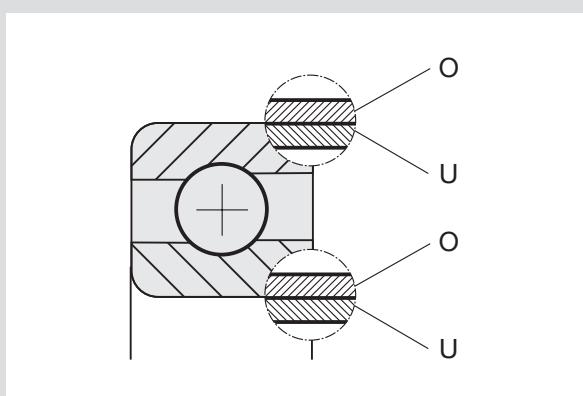

The groups are marked on the box as follows:

Grade	Bore	Outer diameter
X11	O	O
X12	O	U
X21	U	O
X22	U	U
X10	O	-
X20	U	-

O= Upper tolerance half

- = No grading

U= Lower tolerance half

## Preload

The preload is defined as a permanent axial load applied to a bearing.

The advantages of a preload:

- High running accuracy and low vibration level of the bearing arrangement, as the internal clearance is eliminated.
- Reduction of deflection (diagram 1)
- Increase of rigidity of the bearing (diagram 2)
- Reduction of the sliding friction share at high speeds, as the change of the contact angle between inner and outer ring is reduced. A measure of the sliding friction share is the spin/roll ratio (diagram 3)
- Prevents ball skid during high acceleration
- Increases the load-carrying capacity of the bearing arrangement.

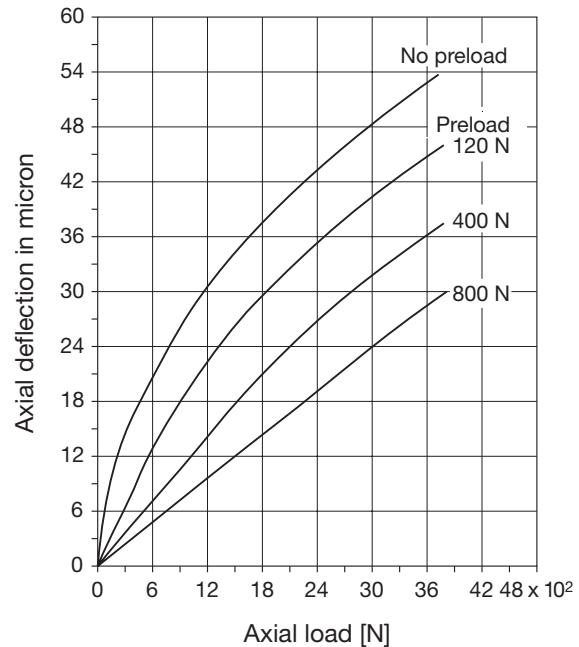

Diagram 1

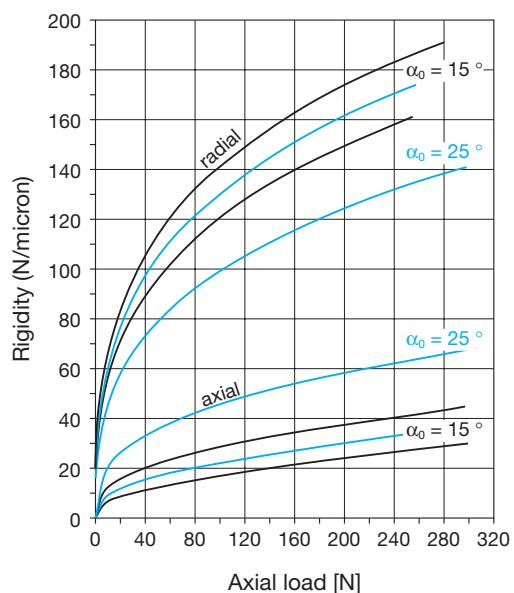

Diagram 2

## Rigidity

The rigidity is defined as the external load of a bearing, which causes a deflection of 1 micron of the bearing rings to each other.

The values for axial rigidity are shown in the bearing tables.

## Lift off force

The lift off force is the limit for the external axial load. Exceeding this value leads to removal of the preload. Condition is a mutual preloaded bearing set.

Consequences when external load exceeds lift off force:

- The balls and the raceways of the relieved bearing are no longer in permanent contact
- Wear rises as sliding friction increases

The values of the lift off force are shown in the bearing tables.

## Minimum preload at high speeds

A minimum preload at high speeds is indispensable to limit the sliding friction share.

Effect of insufficient minimum preload:

- The balls and raceways are no longer in permanent contact
- Wear rises as sliding friction increases
- Reduction of service life

The values for minimum preload are shown in the bearing tables.

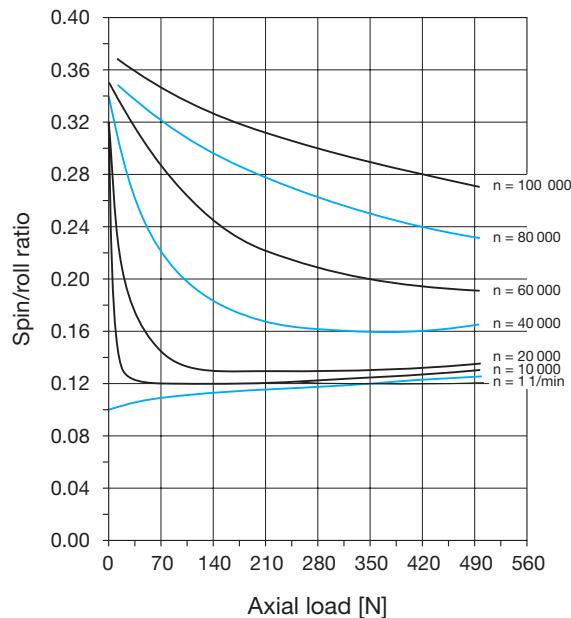

Diagram 3

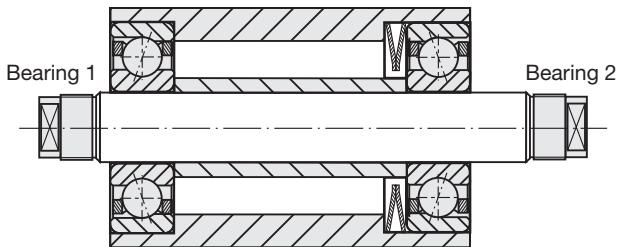

## Types of preload

### Spring preload

Characteristics:

- Insensitive to different thermal expansion of shaft and housing
- Suitable for very high speeds

The drawing shows a spindle where bearing 1 has a fixed location, whereas the outer ring of bearing 2 is free to move axially. The spring force acts on the outer ring of bearing 2 and results in a permanent preload of both bearings almost independent of speed and temperature factors. Care must be taken to ensure easy movement of the adjusted outer ring. Bearings preloaded in this way can be used up to the limiting speed of single bearings if oil lubrication is used. The spring has to be arranged to be effective in the same direction as the external axial load.

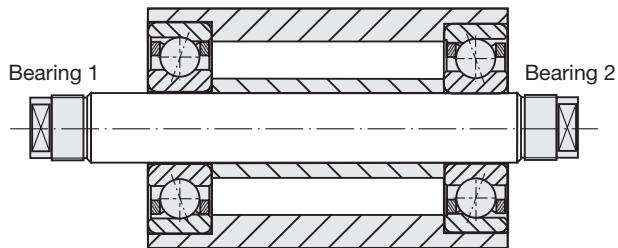

### Rigid preload

Characteristics:

- Higher rigidity at radial loads
- Lower limiting speed compared to spring preload
- The magnitude of preload changes due to length variations as a result of temperature differences between shaft and housing
- Distinct higher axial rigidity than with spring preload

With the spindle shown in the drawing both bearings are paired and mounted stationary in an axial direction. Bearings arranged like this have a defined axial preload. The sleeves shown in the drawing must be ground to identical lengths in one setting. GMN deliver the required bearing pairs with the necessary preload. The change of the preload under operating conditions has to be considered.

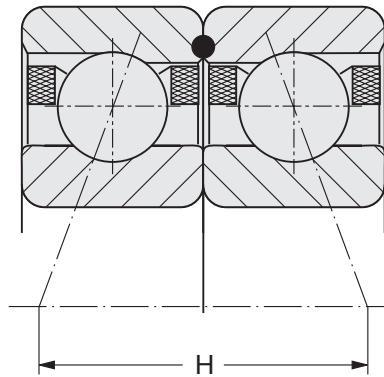

## Bearing arrangements

With the bearing arrangements listed below a large number of applications can be realised.

### DB arrangement

The contact lines diverge towards the bearing center line:

- Large spread H and thus a high rigidity to resist tilting moments
- Takes up axial loads in both directions

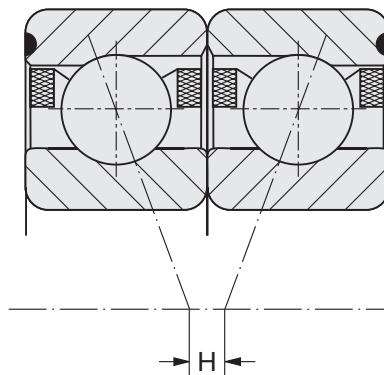

### DF arrangement

The contact lines converge towards the bearing center line:

- The spread H and the rigidity to resist tilting moments are smaller
- This arrangement is less sensitive to angular misalignment

As far as sustaining of loads and bearing deflection are concerned, the DF arrangement behaves like the DB arrangement.

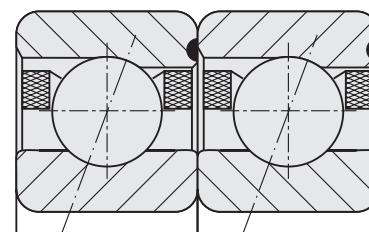

### DT arrangement

Two matched bearings are arranged in parallel in the direction of the load:

- Can be subjected to larger axial loads in one direction than a single bearing
- Both bearings must have the same contact angle and be adjusted against a third bearing

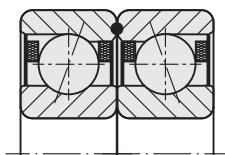

The preload is generally obtained by the use of springs.

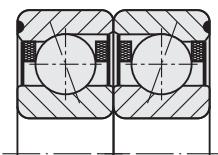

## Multiple bearing arrangements

If a spindle is subjected to large loads or if a high degree of rigidity is required three or more bearings are used assembled in sets in DF, DB or DT arrangement. The drawings below show a few examples of multiple arrangements.

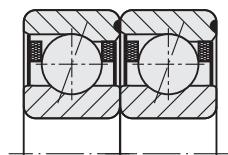

## Bearing sets with 2 bearings

(DB arrangement)

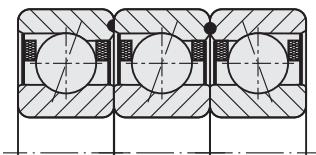

(DF arrangement)

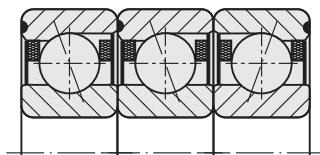

(DT arrangement)

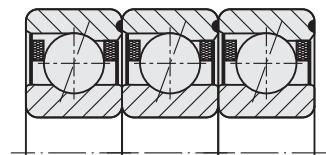

## Bearing sets with 3 bearings

TBT

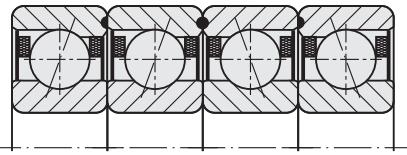

TFT

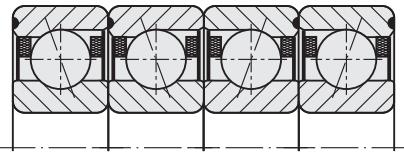

TDT

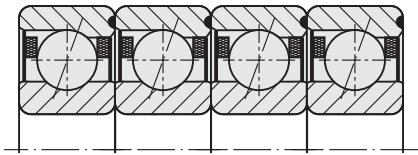

## Bearing sets with 4 bearings

QBC

QFC

QTC

## Spacers

By fitting spacers with matched bearings the following is achieved:

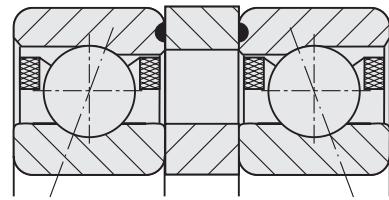

- The spread H (with DF and DB arrangement) is increased
  - Frictional heat is dissipated more effectively
  - Lubrication of the bearing (oil lubrication) is improved as a result of better oil flow
  - Reduction of permissible speed is not required
- Care must be taken to ensure good plane parallelism of spacers (see "accuracy of associated components"). Both spacers must be face ground in one setting.

A change of preload is possible with matched pairs of bearings by means of spacers.

If the spacer on the shaft is smaller than the spacer in the housing, then...

- Preload will be decreased with DF arrangement
- Preload will be increased with DB arrangement

Necessary dimensions can be obtained on request.

## Universal matching

Matched bearings are universally ground as standard. All bearings of identical size and match can be mounted in pairs or sets in DF, DB or DT arrangements.

Note: Symbol , as shown in drawing = marked face of the outer ring and identifies the type of bearing arrangement.

## Gauge matching

Bearings matched in this way come in pairs or sets and may not be mixed with bearings from a different box. The bearings within a set are numbered consecutively. For correct mounting the

bearing pairs or sets are marked on the outside surface with < or >. The > (arrow) indicates the direction of adjustment inner to outer ring.

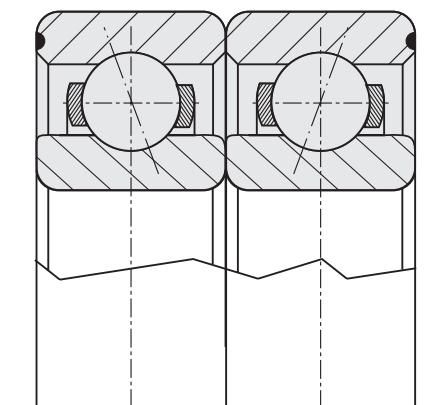

## Matched deep groove bearings

In many cases, bearing applications demand higher axial or radial capacity and smaller bearing dimensions or higher rigidity or a certain range of axial play. Such requirements can be met by matched bearings.

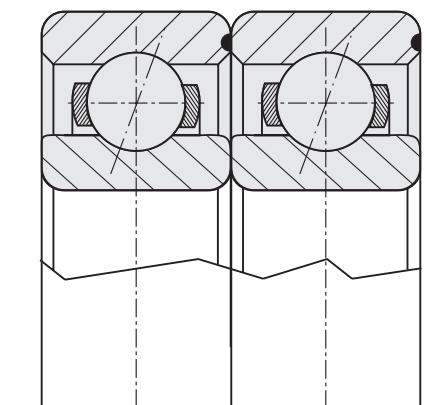

Only bearings from the same series and same dimension can be matched.

### 1. Universal matching

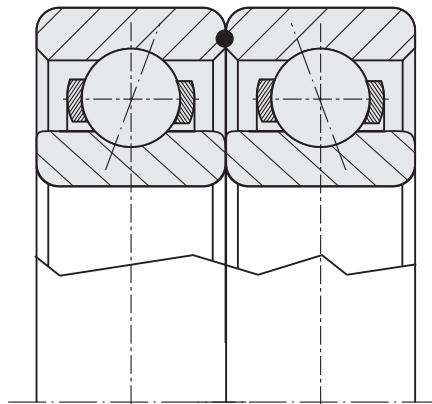

By universal matching single bearings can be assembled to DF, DB or DT configuration. Bearings with the same kind of matching (e.g. universal matching with same axial play, without axial play or with same preload) can be interchanged within their respective group.

DF arrangement

DT arrangement

DB arrangement

When mounting universal matched bearings in the DT arrangement, with or without axial play or with preload the axial load is equally distributed.

Universal matched bearings from the same type of matching can be combined to form larger groups in the DF/DT arrangement or DB/DT arrangement with more than two bearings if required.

**Universal matching takes place with a measured load or a preload as shown in chart 3.1.**

When mounting universal matched bearings the etching on the rings (type designation) must be noted according to the following illustrations.

● = etching on the rings (type designation)

### 1.1. Universal matching with axial play

Symbol **DUA**

The bearings are prepared in such a way that with inner and outer rings locked together in the DF or DB arrangement, a certain axial play is included. As the magnitude of the axial play depends on the operating conditions, the axial play must be specified for each individual application. For example with axial play 40 to 60 microns, the symbol reads DUA 40.60.

### 1.2. Universal matching without axial play

Symbol **DUO**

The bearings are prepared in such a way that with inner and outer rings locked together in DF or DB arrangement, there is no axial play in the bearing set.

### 1.3. Universal matching with preload

Symbol **DUV**

When a rigid bearing arrangement, free from play, is required, a matching of bearings with preload is used. Bearings matched with preload have the advantage that under the effect of an external load only a small elastic deformation takes place, compared to unmatched bearing pairs or single bearings. The bearings are prepared in a way that with inner and

outer rings locked together they are under the effect of a preload. The preload has to be considered as an additional axial load in the life time calculation.

The preload of DUV matched bearings is 2% of the dynamic load rating, however the max is 300N. A preload can be specified to suit your requirements.

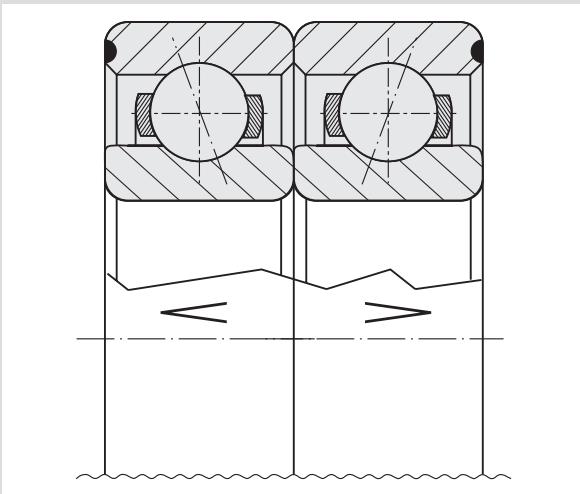

## 2. Special matching

These bearings will be packed in pairs.

### 2.1. DF arrangement

Symbol **DF**

With the DF arrangement the bearing pair has an axial play of 5 to 15 microns. In case a definite axial play is required, the numbers will be added to the symbol, e.g. bearing pair with axial play 40 to 60 microns: DF/40.60.

When mounting the bearings care must be taken that the arrows on the outer surface correspond to the arrangement shown in the above drawing (here e.g. DF)

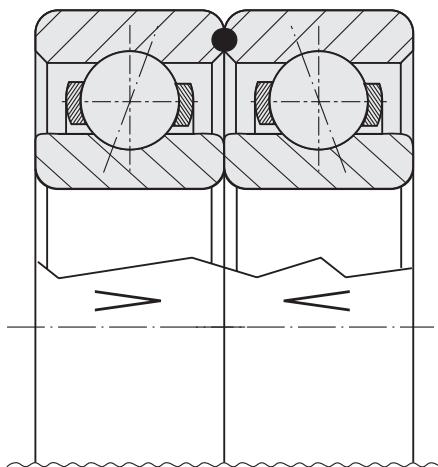

## 2.2. DB arrangement

### Symbol **DB**

The matching in the DB arrangement is free from play. Should a definite axial play be required, the numbers will be added to the symbol, e.g. bearing pair with axial play 20 to 40 microns: DB/20.40.

When mounting the bearings care must be taken that the arrows on the outer surface correspond to the arrangement shown in the opposite drawing. The bearings may not be exchanged for bearings of the same type of matching.

The matching takes place with the measuring load according to chart 3.1.

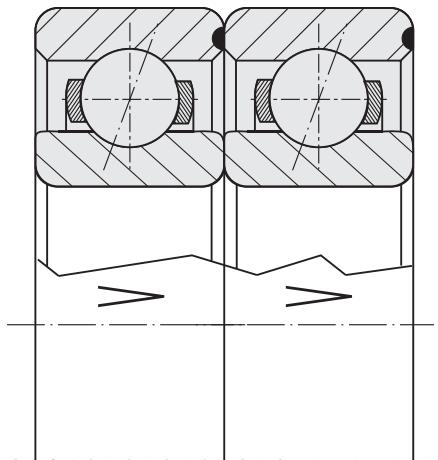

## 2.3. DT arrangement

### Symbol **DT**

This configuration is applied if axial loads from one direction are supported by two bearings.

When mounting the bearings, care must be taken that the arrows on the outer surface correspond to the arrangement shown in the opposite drawing. The bearings may not be exchanged for bearings of the same type of matching.

The matching takes place with the measuring load according to chart 3.1.

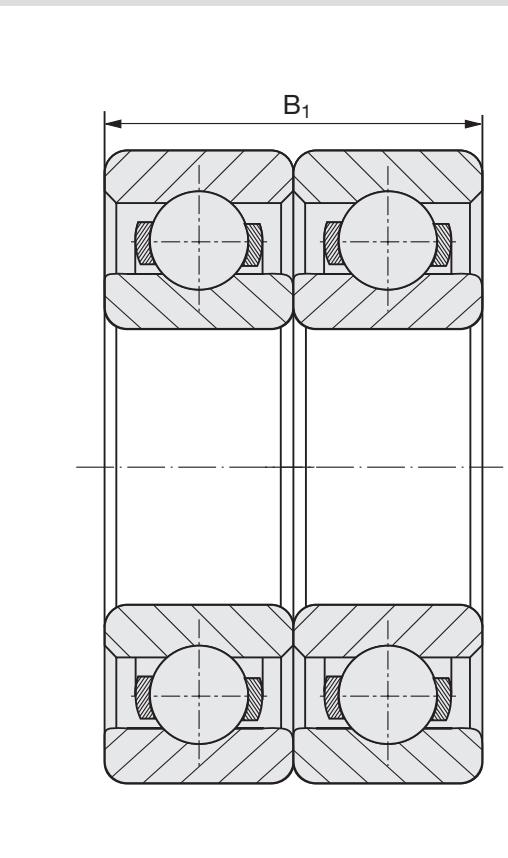

### 3. Measuring loads and tolerances

#### 3.1. Measuring loads and preloads

Type of matching			Measuring load	
DF DUA	DB DUO	DT	d	
			3 - 7 mm	12 N
			8 - 15 mm	22 N
			15 - 30 mm	32 N
			over 30 mm	50 N
DUV				2% of dynamic load rating
Preload meeting the individual application				however max 300N

#### 3.2. Width tolerance of matched deep groove bearings

Type of matching	Width tolerance $B_1$ [microns]	
DF DT	DB	0 - 250
DUA DUV	DUO	0 - 500

## Lubrication

The correct choice of lubricant and method of lubrication is as important for the proper operation of the bearing as the selection of the bearing and the design of the associated components.

### Grease lubrication

Grease should be used if ...

- Maintenance-free operation over long periods of time is desired
- The maximum speed of the bearing does not exceed the speed factor  $n_{xdm}$  of the grease
- The heat generated is almost uniformly dissipated by the environment
- Low friction losses are required with bearings working under small loads and at high speeds

#### Running-in period with grease lubrication

In order to obtain an optimum lubrication effect and grease life it is advisable to provide for a running-in period for bearings for high-speed applications. A better grease distribution and, at the same time, a low bearing temperature are thus achieved.

Grease manufacturers offer a multitude of greases suitable for high speeds. The  $n_{xdm}$  factor is a criterion for the selection of the grease taking into consideration bearing size and operating speed.

$$n \cdot dm_{brg} = \frac{n \cdot (D + d)}{2} \quad [\frac{\text{mm}}{\text{min}}]$$

D: Bearing outside diameter [ mm ]

d: Bearing bore diameter [mm]

n: Bearing operating speed [1/min]

The following table shows a selection of greases which can be used for high speeds (speed coefficient  $n_{xdm} \geq 1 \cdot 10^6$  mm/min). Depending on the specific application, it is possible to attain speeds up to  $1.5 \cdot 10^6$  mm/min and higher with synthetic high speed greases.

GMN code	Thickener	Base oil	Kinem. viscosity for base oil to DIN 515 approx. mm <sup>2</sup> /s 40 °C   100 °C	Consistency	Temperature range to [°C]	Comments on application
274	Special-lithium	PAO/Ester	25   6.0	2/3	- 40 ... + 140	High speed grease. Very good wear protection. Very suitable for hybrid bearings with ceramic balls. Affords good corrosion protection.
007	Lithium-soap	Ester + Mineral	15   4.5	2	- 50 ... + 120	Low load. Very low frictional moments
122	Lithium-soap	Synthetic hydro-carbon	19   4.2	0	- 60 ... + 130	Special wear protection. Suitable for relatively high loads, low frictional moment.
005	Barium-complex	Ester + Mineral	23   4.7	2	- 30 ... + 130	Very good wear protection. Very low frictional moment. Highly suitable for hybrid bearings with ceramic balls. Affords good corrosion protection. Good resistance to water. Highly resistant to ageing.
249	Special-calcium	Ester + Mineral	23   4.7	2	- 40 ... + 130	Very good wear protection. Very low frictional moment. Highly suitable for hybrid bearings with ceramic balls. Affords good corrosion protection. Good resistance to water. Highly resistant to ageing.
126	Barium-complex	Synthetic hydro-carbon	30   5.5	2	- 50 ... + 150	Suitable for relatively high loads. Offers good corrosion protection. Very good resistance to water. Highly resistant to ageing.

## Oil lubrication

Oil lubrication should be provided if ...

- High speeds do not permit the use of greases
- The lubricant must simultaneously serve to cool the bearing

The most widely used lubricating methods are:

### • Oil mist lubrication

The oil mist is produced in an atomiser and conveyed to the bearings by an air current. The air current also serves to cool the bearings and the slightly higher pressure prevents contamination from penetration.

### • Oil-air lubrication (throwaway lubrication)

The oil is conveyed to the bearing in droplets by compressed air. The droplet size and the intervals between two droplets are controlled.

### • Oil-jet lubrication (cooling lubrication)

Considerable amounts of oil are carried through the bearing by injection, the frictional heat generated in the bearing is dissipated. The cooling of the oil is achieved e.g. with an oil-to-air heat exchanger.

Frequently used oils are listed in the following table:

Oil grade	Setting point ca. [°C]	Flash-point ca. [°C]	Kinematic viscosity for base oil [mm <sup>2</sup> /s]		Temperature range approx. [°C]	Specification	Remarks/Application
			40°C	100°C			
Mineral	-33	+120	32.0	5.4	-25 ... +80		Good corrosion and ageing resistance, oil-air lubrication
Mineral	-36	+98	3.1 at 20°C	2.1 at 40°C	-		Stable against oxidation, non-corrosive, oil injection lubrication
Ester	-70	+205	12.0	3.2	Approx. -65 ... +100		Low-temperature and long-life oil, subjectionable to high pressure, oxidation stable with flat V/T diagram measuring technology, turbines, tape recorders
Alkoxy-fluor	-30	non-flammable	190.0	22	-25 ... +220		Vacuum up to $1.33 \times 10^{-10}$ bar, radioactive radiation up to $5 \times 10^6$ J/kg resistance to aggressive chemicals and organic solvents
Synthetic	-60	+220	12.2	3.2	to +130	MIL-L-6085A AIR 3511A	Low degree of evaporation, particularly suitable for low temp., resistant to oxidation and corrosion/aircraft bearings, instr. bearings, wick-feed lubrication
Ester	-68	+220	14.3	3.7	-50 ... +120	MIL-L-6085A	Good resistance to ageing and corrosion, low degree of vaporization aircraft bearings, instrument bearings
Mineral	-51	+150	10.0	7.4 at 50°C	-20 ... +80		Favourable viscosity/temperature relationship, high resistance to ageing grinding spindles, spindles in textile machines, oil-mist lubrication
Mineral	-50	>150	10.0	8.5 at 50°C	-40 ... +80		Favourable viscosity/temperature relationship, high resistance to ageing grinding spindles, spindles in textile machines, oil-mist lubrication
Silikon	-65	+280	60.0	20	-55 ... +200		High- and low-temperature oil space industry, aircraft industry, tape recorders etc. only when C/P > 40 and speed characteristic ( $n \cdot d_m$ ) > 200 000

## Accuracy of associated components

The machining quality and the correct selection of fits with regard to bearing seats are of great importance for the proper operation of a precise bearing application.

Standard **values for shaft and housing fits** for precision classes P4, HG, UP, P2 are listed in the following tables.

### Shaft (rotating)

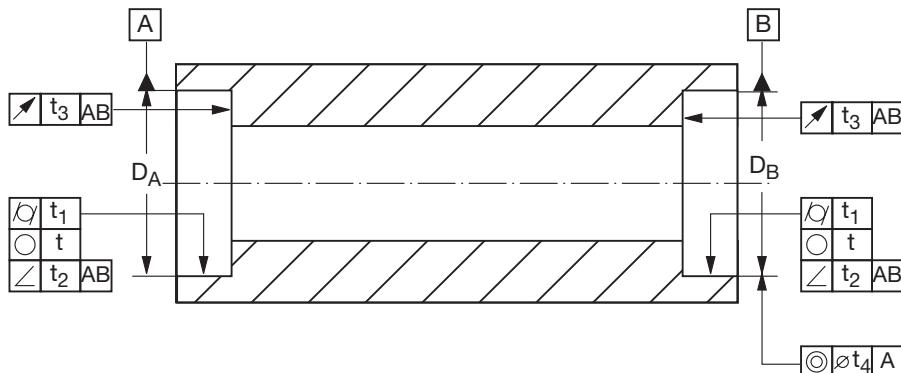

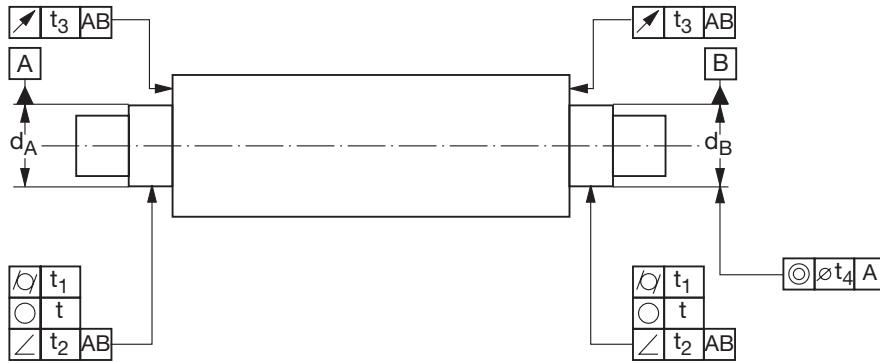

Nominal diameter (mm)		Over Incl.	3 6	6 10	10 18	18 30	30 50	50 80
Shaft limits (micron)	P4	Upper Lower	-0 -5	-0 -5	-0 -6	-0 -7	-0 -8	-0 -9
	P2 HG UP	Upper Lower	-0 -4	-0 -4	-0 -5	-0 -6	-0 -7	-0 -8

### Housing

Nominal diameter (mm)			Over Incl.	10 18	18 30	30 50	50 80	80 120
Housing limits (micron)	P4	Locating bearing	Upper Lower	+ 8 + 0	+ 9 + 0	+ 10 + 0	+ 11 + 0	+ 12 + 0
	P4	Floating bearing	Upper Lower	+ 10 + 2	+ 11 + 2	+ 13 + 3	+ 14 + 4	+ 15 + 4
	P2 HG UP	Locating bearing	Upper Lower	+ 5 + 0	+ 6 + 0	+ 7 + 0	+ 8 + 0	+ 9 + 0
	P2 HG UP	Floating bearing	Upper Lower	+ 7 + 2	+ 8 + 2	+ 9 + 2	+ 10 + 2	+ 11 + 2

The running accuracy and low operating temperature of the bearing application depend on the machining quality with regard to abutment surfaces and bearing seats.

**Standard values for form and position tolerances** are listed in the following tables.

Property	Symbol for tolerance	Tolerance value	Permissible deviation of form for bearings of tolerance classes	
			P4 (HG)	P2 (UP)
Roundness	$\bigcirc$	$t$	IT1	IT0
Conicity (Taper)	$\bigtriangleup$	$t_1$	IT1	IT0
Angularity	$\angle$	$t_2$	IT1	IT0
Axial runout	$\nearrow$	$t_3$	IT1	IT0
Concentricity (Misalignment)	$\bigodot$	$t_4$	IT3	IT3

Nominal diameter in (mm)	Tolerance quality in micron			
	IT0	IT1	IT2	IT3
> 6 - 10	0.6	1	1.5	2.5
> 10 - 18	0.8	1.2	2	3
> 18 - 30	1	1.5	2.5	4
> 30 - 50	1	1.5	2.5	4
> 50 - 80	1.2	2	3	5
> 80 - 120	1.5	2.5	4	6

## Bearing calculation

The method of calculation described as follows is an extract from DIN/ISO 76 (static load rating) and DIN/ISO 281 (dynamic load rating, life rating).

### 1. Definition of dynamic load rating C

for two or more spindle bearings in DF, DB or DT arrangement:

$$C = i^{0,7} \cdot C_{\text{single bearing}} \quad [\text{N}]$$

i : Number of bearings in bearing set  
 $C_{\text{single bearing}}$ : Load rating of single bearing (N)

### 2. Definition of equivalent dynamic load P

$$P = X \cdot F_r + Y \cdot F_a \quad (\text{N})$$

X,Y : Radial factor, axial factor  
 $F_r, F_a$ : Radial load, axial load (N)

The preload of the bearing must be taken into consideration:

1. If  $K_a \leq 3 \cdot F_v$  then use  $F_a = F_v + 0,67 \cdot K_a$  [N]
  2. If  $K_a > 3 \cdot F_v$  then use  $F_a = K_a$  [N]
- $K_a$  : external axial load (N)  
 $F_v$  : Preload of a bearing set (N)

### 3. Definition of X and Y factors

	Relative in axial load $i \cdot F_a / C_0$ 1)	Single bearing DT arrangement 2)				Bearing pair DF or DB arrangement			
		e	$F_a / F_r \leq e$	$F_a / F_r > e$	X	Y	X	Y	X
Spindle bearing Contact angle 15 °	0.015	0.38				1.47		2.39	2.39
	0.029	0.40				1.40		1.57	2.28
	0.058	0.43				1.30		1.46	2.11
	0.087	0.46				1.23		1.38	2.00
	0.120	0.47	1	0	0.44	1.19	1	1.34	1.93
	0.170	0.50				1.12		1.26	1.82
	0.290	0.55				1.02		1.14	1.66
	0.440	0.56				1.00		1.12	1.63
	0.580	0.56				1.00		1.12	1.63
	Spindle bearing Contact angle 25 °	0.68	1	0	0.41	0.87	1	0.92	0.67
Deep groove bearing Standard radial play	0.014	0.23				2.30		2.78	3.74
	0.028	0.26				1.99		2.40	3.23
	0.056	0.30				1.71		2.07	2.78
	0.085	0.34				1.55		1.87	2.52
	0.110	0.36	1	0	0.56	1.45	1	1.75	2.36
	0.170	0.40				1.31		1.58	2.13
	0.280	0.45				1.15		1.39	1.87
	0.420	0.50				1.04		1.26	1.69
	0.560	0.52				1.00		1.21	1.63
	Deep groove bearing radial play C3	0.014	0.29			1.88		2.18	3.06
		0.029	0.32			1.71		1.98	2.78
		0.057	0.36			1.52		1.76	2.47
		0.086	0.38			1.41		1.63	2.29
		0.110	0.40	1	0	1.34	1	1.55	2.18
		0.170	0.44			1.23		1.42	2.00
		0.290	0.49			1.10		1.27	1.79
		0.430	0.54			1.01		1.17	1.64
		0.570	0.54			1.00		1.16	1.63

1)  $C_0$ : Static load rating (N)

2) For DT arrangement set  $i=1$  and use  $F_a$  and  $C_0$  values related to single bearing

#### 4. Definition of nominal life rating $L_{10h}$

$$L_{10h} = \frac{10^6}{60 \cdot n} \cdot \left(\frac{C}{P}\right)^3 \text{ [hours]}$$

n: Speed (1/min)  
 C: Dynamic load rating (N)  
 P: Equivalent dynamic load (N)

The nominal life rating is based on a 10% probability of failure.

#### 5. Definition of adjusted life rating $L_{nah}$

$$L_{nah} = a_1 \cdot a_{23} \cdot f_t \cdot L_{10h} \text{ (hours)}$$

$a_1$  : Factor for probability of failure  
 $a_{23}$  : Factor for material and operating conditions  
 $f_t$  : Factor for operating temperature  
 $L_{10h}$ : Nominal life rating (hours)

Probability of failure (%)	10	5	4	3	2	1
Factor $a_1$	1	0.62	0.53	0.44	0.33	0.21
Maximum operating temperature (°C)	150	200	250	300		
Factor $f_t$	1	0.73	0.42	0.22		

#### 6. Definition of factor for material and operating conditions $a_{23}$

Step 1:

The operating viscosity  $\nu$  is determined in diagram 1. For grease lubrication, the viscosity of the base oil is entered.

Step 2:

The reference viscosity  $\nu_1$  is determined in diagram 2.

Step 3:

After calculation of the viscosity ratio  $\nu/\nu_1$ , the  $a_{23}$ -factor is determined in diagram 3.

Comments on diagram 3:

- Lower line : Normal operating conditions and cleanliness.
- Middle line: Improvement of  $a_{23}$ -factor by EP-additives.
- Upper line : Improvement of  $a_{23}$ -factor by extreme (highest) cleanliness and optimised spin and slide conditions.

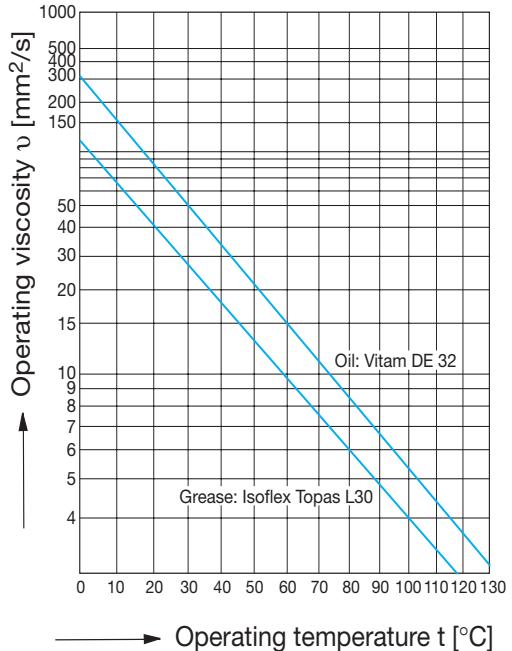

Diagram 1

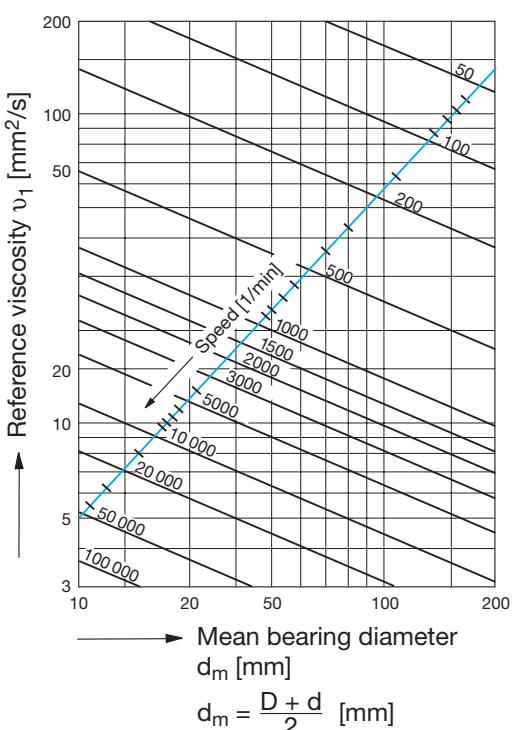

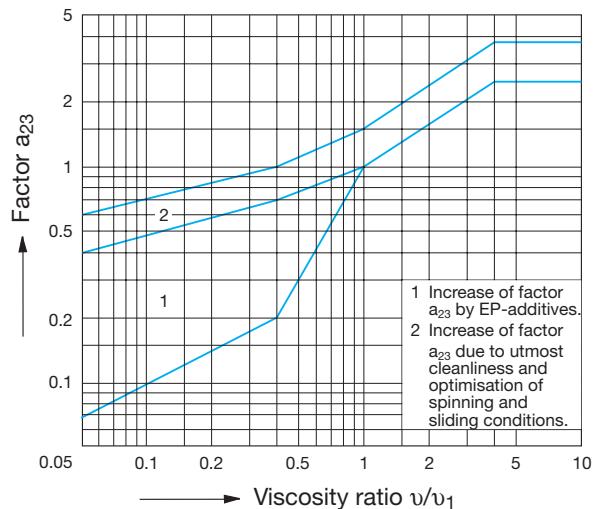

Diagram 2

With the adjusted life time rating it is possible to take into account various influencing parameters:

- Probabilities of failure, deviating from 10% ( $a_1$ -factor)
- Material properties ( $a_2$  -factor): GMN uses steel with a particularly high degree of purity, therefore:  $a_2 = 1$
- Lubricant film thickness, lubricant additives, contamination ( $a_3$  - factor)
- Deviation from normal operating temperature ( $> 150^\circ\text{C}$ ) ( $f_t$  - factor)

Apart from the fatigue life (theoretical life rating) the actual service life of a bearing is determined also by wearlife rating and the service life of the grease.

## Definition of static load rating $C_0$

### 1. Definition of static equivalent load $P_0$

$$P_0 = X_0 \cdot F_r + Y_0 \cdot F_a$$

if  $P_0 < F_r$ , then use  $P_0 = F_r$

$X_0, Y_0$ : Radial factor, axial factor: see table  
 $F_r, F_a$ : Radial load, axial load (N)

	Single bearing DT arrangement		Bearing pair in DF or DB arrangement	
	$X_0$	$Y_0$	$X_0$	$Y_0$
Contact angle 15 °	0.5	0.46	1	0.92
Contact angle 25 °	0.5	0.38	1	0.76
Deep groove bearing	0.6	0.5		

### 2. Definition of static coefficient $f_s$

$$f_s = i \cdot C_0 / P_0$$

$i$  : number of bearings

$C_0$ : Static load rating (N)

$P_0$ : Static equivalent load (N)

- The value of the static coefficient should be above 2.5
- The static coefficient describes the safety against excessive plastic deformation of the points of contact of balls and raceways.

## Service life of grease - Lubrication intervals

The lubricating interval is defined on principle as the value for a 10 to 20% probability of failure of the service life of the grease.

The service life of the grease is essentially dependent on the influencing parameters

- Grease
- Operating conditions
- Design

Therefore, the selection of the grease is of decisive importance. In the opposite graph (reproduced from the Recommendations 2.4.1 of the Society of Tribology), **the lubricating interval  $t_f$**  is plotted against the operating speed and the limiting speed of grease lubrication. It provides guiding values for the service life and applies to lithium soap grease up to an operating temperature of +70 °C (measured on the outer ring) and moderate conditions of loading ( $P/C < 0.1$ ).

**Special environmental factors**, such as humidity and vibration will decrease the lubricating interval to 1/5 of the initial value.

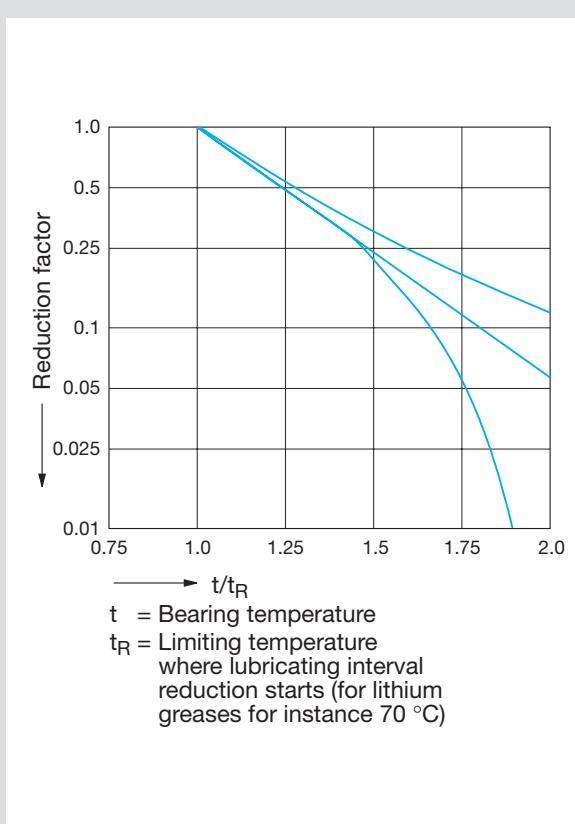

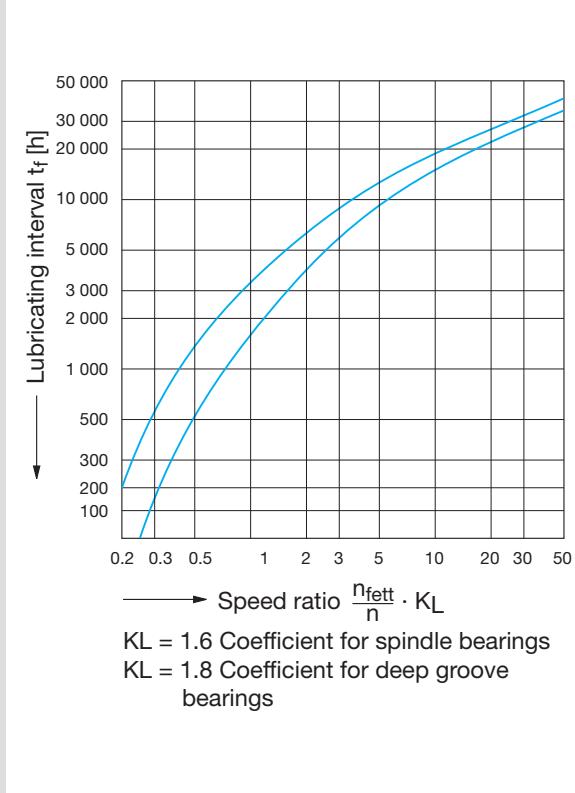

### Unusual conditions of operation

e.g. extreme temperatures and high loading ( $P/C > 0.1$ ) call for special greases. These greases will enable longer lubricating intervals to be achieved than those obtained from the graph.

Lubricating intervals of more than 5 years are possible only under very favourable environmental conditions.

### Reduction in lubricating intervals at high temperatures

The degradation of the lubricating greases increases considerably at higher temperatures. A temperature increase by 15 K, starting at 70 °C, will decrease the lubricating interval to half the initial value, particularly with lithium greases. Guidance is provided by the graph.

The stable operation condition of a bearing is endangered as soon as the limiting speed is attained or exceeded. Within the range of the contacting areas between the balls and the rings friction and temperature increase progressively.

The friction generated in the bearing depends essentially on:

- Speed
- Bearing load
- Viscosity of the lubricant
- Amount of lubricant

## Limiting speed for spindle bearings

The speeds listed in the tables are attainable speeds for a single spring-preloaded bearing operating under normal conditions such as

- Good heat dissipation
- Low external load
- Rotating inner ring
- Oil-mist or oil-air lubrication
- Good form accuracy of associated components
- Alignment of associated components

If the operating conditions deviate from the conditions mentioned these must be taken into account by correction factors.

Correction factors and speed values are only for guidance.

$$\text{Permissible speed} = \text{speed value} \cdot f_{n1} \cdot f_{n2} \cdot f_{n3}$$

## Correction factors

$f_{n1}$ : Lubrication		S BHT BNT	SM	SH	SMI
Grease lubrication (note n x dm factor in grease table) Oil-air or oil-mist lubrication Oil-jet lubrication	0.8	0.8	-	-	
	1.0	1.0	-	1.0	
	1.2	1.2	1.2	-	
$f_{n2}$ : Bearing arrangement bearing pairs	Single bearing with spring preload Bearing pairs with spacers spring preloaded Bearing pairs in DT-arrangement without spacers, spring-preloaded bearing pairs in DF or DB arrangement With axial clearance With preload UL With preload UM With preload US	1.0 1.0  0.8  0.7 0.6 0.45 0.3			
$f_{n3}$ : Kinematics	Rotating inner ring Rotating outer ring	1.0 0.6			

With speeds in the limiting range, minimum preloads are required which are listed in the bearing tables for bearing series SM/SH/SMI/BHT60. As for bearing series S 60/62 and BNT 62 please contact our engineering department for the minimum preload.

## Limiting speed for deep groove bearings

The speeds listed in the tables are attainable speeds for a single spring-preloaded bearing operating under normal conditions such as

- Good heat dissipation
- Low external load
- Rotating inner ring
- Grease lubrication
- Good form accuracy
- Good balancing of rotating parts

If the operating conditions deviate from the conditions mentioned these must be taken into account by correction factors.

Correction factors and speed values are only for guidance.

$$\text{Permissible speed} = \text{Speed value} \cdot f_{n1} \cdot f_{n2} \cdot f_{n3} \cdot f_{n4}$$

## Correction factors

$f_{n1}$ : Lubrication	Grease lubrication (note $n \times dm$ factor of grease) Oil-mist lubrication	1.0 1.25

## Basic rules for storage and assembly

- Store bearings in the original box
- Protect bearings against moisture
- Grease lubricated bearings: with proper storage approximately one year possible
- Check conditions of associated components
- Clean work place and suitable tools
- In general no rinsing of bearings
- For grease lubrication: Specify amount of grease (standard value 30% of void space, check with GMN) and equally grease the bearing in the ball/raceway area.
- No cocking of bearing during mounting. Heat bearing inner ring to max 100°C.

## Failure analysis

GMN provides a service to analyse damage to GMN bearings.

For this purpose please note:

- Send bearings to GMN without cleaning them
- Mark mounting position (fixed / floating bearing, direction of load etc.)
- Describe operating conditions

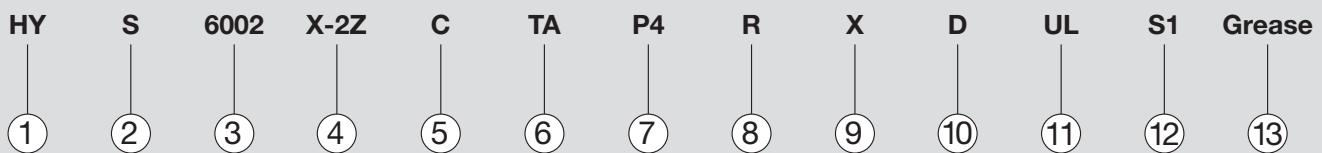

## Change of preload

A change of preload is possible with matched pairs of bearings by means of spacers.

If the spacer on the shaft is shorter in length than the spacer in the housing, then ...

- Preload will be decreased with the DF arrangement
- Preload will be increased with the DB arrangement

Necessary dimensions of spacers can be obtained on request.

(1) Material	- Bearings made from chrome steel have no prefix <b>M</b> Bearings made from high temperature steel <b>N</b> Bearings made from HNS-Steel <b>HY</b> Balls and rings from different materials (Hybrid bearings)
(2) Bearing type	<b>S</b> Two lands on the inner ring <b>SN</b> Two lands on the outer ring, for grease lubrication <b>SM</b> Two lands on the inner ring, for high speed applications <b>SMI</b> Two lands on the inner ring, for high speeds, but with lubricant supply through the inner ring <b>SH</b> One land on the inner ring and the outer ring, optimum for oil-jet lubrication <b>BNT</b> Two lands on the outer ring, inner ring removable <b>BHT</b> Two lands on the outer ring, inner ring removable, for high speed applications
(3) Bearing size	<b>6002</b> Designation of dimension series and bore
(4) Special dimensions	<b>X-2Z</b> Extra wide, shields with snap rings on both sides of the bearing*
(5) Contact angle	<b>C</b> 15° <b>E</b> 25° $\alpha$ 18° Special feature*
(6) Cage	<b>TA</b> Laminated phenolic resin cage or polyamide cage guided on outer ring <b>TB</b> Laminated phenolic resin cage guided on inner ring* <b>TAM</b> Laminated phenolic resin cage guided on outer ring, ball retaining <b>TXM</b> Molded plastic cage guided on outer ring, ball retaining*
(7) Precision	<b>P4</b> Is equivalent to P4S according to DIN 628-6 <b>P2</b> Tolerance class P2 according to DIN 620 <b>A 7</b> Tolerance class ABEC 7 according to ABMA <b>A 9</b> Tolerance class ABEC 9 according to ABMA <b>A7/9</b> Dimensional and form accuracy according to A7, running accuracy according to A9 <b>HG</b> GMN high precision according to GMN specification <b>UP</b> GMN ultra precision according to GMN specification
(8) High pointing	<b>R</b> Indication of the point of radial runout (maximum wall thickness) on inner and outer ring <b>R<sub>i</sub></b> Like R, however only on the inner ring <b>R<sub>a</sub></b> Like R, however only on the outer ring
(9) Grading	<b>X</b> Grading of bore and outer diameter
(10) Bearing sets	<b>D</b> 2 bearings <b>T</b> 3 bearings <b>Q</b> 4 bearings
(11) Matching	<b>UL</b> Universal matching - light preload <b>UM</b> Universal matching - medium preload <b>US</b> Universal matching - heavy preload <b>UV</b> Universal matching - preload by agreement <b>DF</b> Face-to-Face arrangement <b>DB</b> Back-to-Back arrangement <b>DT</b> Tandem arrangement
(12) Heat treatment	<b>S1</b> Operating temperature up to 200 °C * <b>S2</b> Operating temperature up to 250 °C * <b>S3</b> Operating temperature up to 300 °C *
(13) Lubrication	Designation of grease, e.g. <b>Turmogrease HS L252</b>

\* available on request.

# GMN GMN

In this table similar types of bearings are listed according to bearing design. The designations given

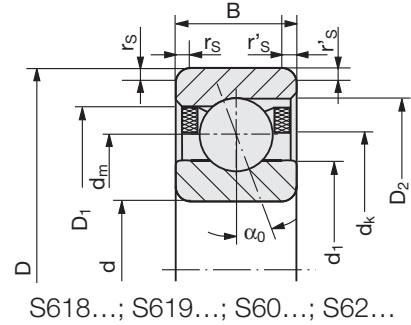

contain only the basic types, not exact details such as precision, matching, preload etc.

## Spindle bearings

The following notations are used in the bearing tables:

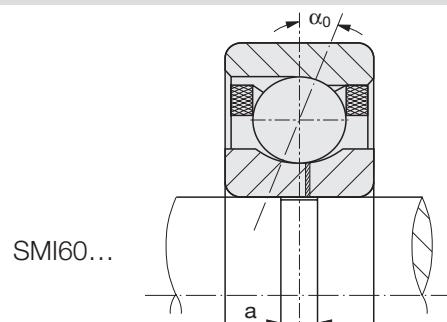

$d$ [mm]	Bore diameter
$D$ [mm]	Outer diameter
$B$ [mm]	Width single bearing
$r_s$ [mm]	Chamfer
$r'_s$ [mm]	Chamfer open side (spindle bearing)
$a$ [mm]	Width of ring groove for SMI-lubrication
$D_w$ [mm]	Ball diameter
$Z$ pieces	Ball complement
$m$ [kg]	Weight of bearing
$d_1$ [mm]	Outer diameter inner ring
$d_2$ [mm]	Land inner ring, open side
$d_k$ [mm]	Cage bore
$d_m$ [mm]	Pitch circle diameter
$D_1$ [mm]	Bore outer ring
$D_2$ [mm]	Bore outer ring (open side)
$n$ [1/min]	Speed value
$C$ [N]	Dynamic load rating
$C_0$ [N]	Static load rating
$F_v$ [N]	Preload
$F_{a\max}$ [N]	Lift off force
$C_{ax}$ [N/micron]	Axial rigidity (pair)
$F_f$ [N]	Minimum spring preload
$\alpha_0$ [°]	Contact angle

### Speed values for oil lubrication

## Special ball bearings

For certain applications it is not possible to use to a ball bearing from the standard catalogue range.

Limited dimensions, special kind of lubrication or special guidance of the lubricant flow do not permit supplementary parts but cause a need for adaptation of the ball bearing, based on a standard execution, to the application.

Therefore, GMN offers the possibility to let the adaptation take place by designing special bearings. Deviating from the variations given by the designation system, special bearings can be developed in co-operation with our technical application service and our construction department and produced in economical batch quantities.

These special bearings will not be coded according to our designation system but will be coded in numerical order, starting with 04 ...

### Examples for a special bearing:

- 04365 Execution in compliance with 608 X-2Z, with an outer diameter of 24 mm instead of 22 mm.
- 04424 Based on 629 2Z, with convexly ground outer ring, without radial play and delivered with an additional sleeve.
- 04063 Special execution, but due to high demand this execution became part of our standard production range as 6001 X-2Z (listed on page 59).
- 04222 Special execution of spindle bearing S 6206 C TB HG with removable outer ring.

GMN offers the possibility of further adaptation to the application by means of **complete ready to install bearing units**, e.g. shaft including bearings, preload springs and housing sleeve.

For further information please refer to our homepage [www.gmn.de](http://www.gmn.de) section „Ball Bearings – Special Bearings, Bearing Units resp. Vacuum Technology, Dry Lubrication“ or contact our technical application service. The phone numbers are listed on page 5.

<b>①</b> Material	- Bearings made of chrome steel have no prefix <b>M</b> Bearings made of high temperature steel (on request) <b>HY</b> Balls and rings from different materials (hybrid bearings)
<b>②</b> Bearing size	<b>6202</b> Designation of dimension series and bore
<b>③</b> Features Sealing	<b>Z</b> Shield with snap ring on one side of the bearing <b>2Z</b> Shields with snap rings on both sides of the bearing, with bearing pairs (matched bearings) shields are on the outside faces
<b>④</b> Cage	<b>J</b> Cage, steel sheet <b>T9H</b> Snap cage, glass-fibre-reinforced polyamide, ball riding <b>TBH</b> Snap cage, laminated phenolic resin, inner-land-riding <b>TA</b> Solid cage, laminated phenolic resin, outer-land-riding <b>TB</b> Solid cage, laminated phenolic resin, inner-land-riding <b>MA</b> Solid cage, brass, outer-land-riding
<b>⑤</b> Precision	<b>P4</b> Tolerance class P4 according to DIN 620 <b>P2</b> Tolerance class P2 according to DIN 620 <b>A7</b> Tolerance class ABEC 7 according to ABMA <b>A9</b> Tolerance class ABEC 9 according to ABMA <b>HG</b> GMN high precision according to GMN specification <b>UP</b> GMN ultra precision according to GMN specification
<b>⑥</b> Bearing clearance	<b>C2</b> Radial clearance smaller than normal - Normal clearance (not shown in code) <b>C3</b> Radial clearance greater than normal <b>C4</b> Radial clearance greater than C3 <b>C5</b> Radial clearance greater than C4 Reduced ranges of radial clearance are noted in clear (values without measuring load)
<b>⑦</b> Matched bearings	<b>DF</b> Face-to-face arrangement <b>DB</b> Back-to-back arrangement <b>DT</b> Tandem arrangement <b>DUA</b> Universally matched with axial clearance <b>DUO</b> Universally matched without axial clearance <b>DUV</b> Universally matched with preload
<b>⑧</b> Heat treatment	<b>S1</b> Operating temperature up to +200 °C <b>S2</b> Operating temperature up to +250 °C <b>S3</b> Operating temperature up to +300 °C
<b>⑨</b> Lubrication	Designation of grease, e.g. <b>Asonic GLY 32</b>

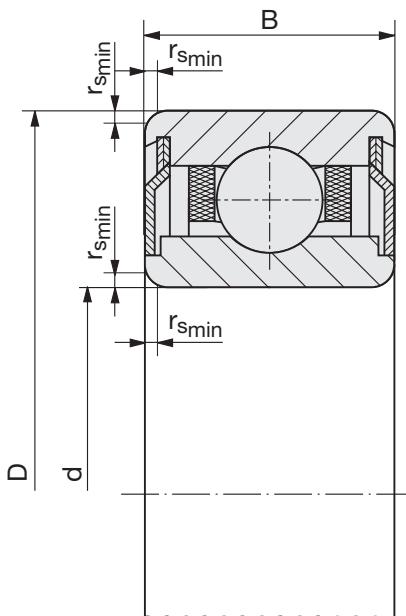

## Deep groove bearings

The following notations are used in the bearing tables:

d [mm]	Bore diameter
D [mm]	Outer diameter
B [mm]	Width, single bearing
$r_{s\min}$ [mm]	Chamfer
$D_W$ [mm]	Ball diameter
Z pieces	Ball complement
m [kg]	Weight
$d_m$ [mm]	Pitch circle diameter
n [1/min]	Speed value
C [N]	Dynamic load rating
$C_0$ [N]	Static load rating

Series 60...; 62...

Series 60...X - 2Z

Speed values for grease lubrication.  
With Z- or 2Z- execution standard grease used is  
KLÜBER Asonic GLY 32; greasefill 30% of void space  
(other types of grease or greasefill on request).

## Dictionary English – German

Abrasive wear	abrasiver Verschleiß
Abutment face	Anlageschulter
Additional coding	Zusatzzeichen
Adjusted bearing mounting	angestellte Lagerung
Adjustment	Anstellung
Aging of lubricant	Alterung des Schmierstoffes
Angular contact bearing	Schrägkugellager
Angle error	Winkelfehler
Associated component	Umbauteil
Axial clearance	Axialluft
Axial force	Axialkraft
Axial load carrying capacity	axiale Belastbarkeit
Axial load factor Y, Yo	Axialfaktor Y, Yo
Axial runout	Axialschlag

Back to back mounting	O-Anordnung
Basic oil	Grundöl
Basic rating life	Nominelle Lebensdauer
Bearing force	äußere Kraft
Bearing order reference	Bestellbezeichnung
Bearing preload	Lagervorspannung
Bearing seat	Lagersitz
Bearing suffix	Nachsetzzeichen
Bearing temperature	Lagertemperatur
Body resonance	Körperschall

Cage	Käfig
Centrifugal force	Fliehkraft
Chamfer dimension	Kantenabstand
Coefficient of expansion	Ausdehnungskoeffizient
Coefficient of thermal expansion	Wärmeausdehnungskoeffizient
Collective bearing loading	Belastungskollektiv
Combined bearing loading	kombinierte Belastung
Connecting dimension	Anschlußmaß
Contact angle	Druck-, Anlaufwinkel
Contact angle line	Drucklinie
Contact ellipse	Druckellipse
Contact pressure	Flächenpressung
Covering part	Umbauteil
Critical rotational speed	kritische Drehzahl

Deep groove ball bearing	Rillenkugellager
Deformation	Aufweitung, Verformung
Dimensional accuracy	Maßgenauigkeit
Dimensional series	Maßreihe
Design of bearing application	Gestaltung der Lagerung
Dynamic load rating	dynamische Tragzahl

Endplay	Axialspiel
Equivalent load	äquivalente Belastung

## Dictionary English – German

Face to face mounting	X-Anordnung
Faulty mounting	Einbaufehler
Fit	Passung
Fixed bearing	Festlager
Floating bearing	Loslager
Force	Kraft
Force flow	Kraftfluß
For life lubrication	Lebensdauerschmierung
Form accuracy	Formgenauigkeit
Form irregularity	Formfehler
Form tolerance	Formtoleranz
Frequency analysis	Frequenzanalyse
Friction	Reibung
Friction limit	Grenzreibung
Frictional wear	Reibverschleiß
High temperature steel	warmfester Stahl
Initial greasing	Befettung
Internal design	Innenkonstruktion
Internal force	innere Kraft
Injection oiling	Einspritzschmierung
Land diameter	Borddurchmesser
Life time	Lebensdauer
Line contact	Linienberührung
Load	Belastung
Load carrying capacity	Belastbarkeit
Load distribution	Lastverteilung
Loading	Belastung
Loading set point	Lastangriff
Lubrication	Schmierung
Material	Werkstoff
Minimum bearing loading	Mindestbelastung
Misalignment	Fluchtfehler, Schrägstellung
Modified life	modifizierte Lebensdauer
Mounting	Montage
Mounting dimension	Einbaumaß
Noise	Geräusch
Noiseless bearing	geräuscharmes Lager
Noise test	Geräuschprüfung
Non separable bearing	nicht zerlegbares Lager
Operating clearance	Betriebslagerluft, -spiel
Operating temperature	Betriebstemperatur
Outside diameter	Außen-, Manteldurchmesser
Out of roundness	Unrundheit
Oversize	Übermaß
Part number system	Bezeichnungssystem
Permanent lubrication	Dauerschmierung
Pitch circle diameter	Teilkreisdurchmesser
Plane accuracy	Planlauf

## Dictionary English – German

Point contact	Punktberührung
Polyurea	Polyharnstoff
Precision grade	Genauigkeitsklasse
Preload	Vorspannung
Pressed cage	Blechkäfig
Probability of failure	Ausfallwahrscheinlichkeit
Quality assurance	Qualitätssicherung
Raceway curvature	Schmiegeung
Radial load factor X, Xo	Radialfaktor X, Xo
Reaction force	Auflagekraft
Referenced operational viscosity	Betriebsviskosität
Rigidity	Steifigkeit, Starrheit
Rolling conditions	Abwälzverhältnisse
Rotational speed limit	Drehzahlgrenze
Roughness	Rauhigkeit, Rauhtiefe
Running accuracy	Laufgenauigkeit
Separable bearing	zerlegbares Lager
Service life	Gebrauchsduer
Shield	Deckscheibe
Side runout	Seitenschlag
Silicone grease	Silikonfett
Sliding friction	Gleitreibung
Snap ring	Sprengring
Solid cage	Massivkäfig
Spacer	Distanzring
Speed	Drehzahl
Speed coefficient	Drehzahlkennwert
Spindle bearing	Spindellager
Spinning force	Kreiselkraft
Spinning friction	Bohrreibung
Spread	Stützbreite
Spring characteristic curve	Federkennlinie
Starting friction	Anlaufreibung
Static load rating	statische Tragzahl
Static loading	statische Belastung
Stiffness	Steifigkeit
Supporting base	Stützbasis
Surface plating	Oberflächenbeschichtung
Survival probability	Überlebenswahrscheinlichkeit
Talyrond diagram	Talyrond Diagramm
Tandem bearing mounting	Tandem-Anordnung
Temperature	Temperatur
Tolerance zone	Toleranzfeld
Unbalanced loading	Belastung durch Unwucht
Vibration	Körperschall, Schwingung
Viscosity	Viskosität
Wall thickness	Wandstärke
Width variation	Breitenschwankung
Working pressure angle	Betriebsdruckwinkel
Young's modulus	Elastizitätsmodul
